

LoreLens Daily SEO Release

Production date: 2026-08-07 (Asia/Shanghai) | Status: locally published, pending release verification

Published route	/ai-roleplay-scene-recovery
Search intent	AI roleplay scene recovery
Decision	create_page - score 74
Draft length	991 words
Presentation	specimen-catalog-v1 / museum-cobalt / no companion / no gallery
Editorial reviewer	codex_editor - approved

What the page answers

Recover a flat scene by naming the stalled beat, making one modest change, and leaving one concrete consequence open.

Reader value and product boundary

Approved facts say the experience begins with an existing plot and an available role, so the guide uses supplied context and a chosen perspective as honest anchors for a recovery exercise.

Public guides support the general craft ideas of context, character perspective, action beats, and pacing. Product statements use only approved facts and make no claims about availability, price, privacy, response speed, specific stories, or technology.

Editorial gate receipt

search-intent: The page answers the narrow post-entry task of repairing a stalled exchange, not the existing beginner, first-message, role-choice, app-selection, or prompt-versus-story intent.

product-truth: Every product statement maps to the approved existing-story, role-selection, voice-roleplay, or interactive-fiction fact; no availability, price, privacy, technical, platform, latency, group, or safety promise appears.

conversion-path: The reviewed CTA is a user-initiated attributed NovelAI route for this exact slug, with the page itself making no claim that it starts a session.

source-accuracy: Six current public evidence records from six domains support general continuity, action-beat, pacing, scene-context, and interactive-story craft; they are not used for unsupported product claims.

content-distinctness: The builder passed complete-corpus text, structure, FAQ, shingle, repeated-sentence, pain-point, and nearest-page novelty checks; the answer diagnoses a later stalled beat.

presentation-distinctness: The draft uses specimen-catalog-v1 with indexed shelves, museum cobalt, catalog typography, and explicit companion=none/gallery=none rather than a previously used visual system.

signature-module: The Scene Recovery Specimen Index is a useful inventory with three original repair labels, a reader action, and a real placement after the diagnostic framework.

rendered-preview: The schema-3 renderer contract has a server-rendered H1, hero, mapped sections, inventory signature, FAQs, related links, page-owned surface copy, and attributed CTA without client-only primary content.

Content and Evidence Receipt

Signature module: Scene Recovery Specimen Index

Specimen A - Missing evidence

Add one observable detail the selected role can notice so another turn has something concrete to respond to.

Specimen B - Oversized action

Reduce the last move until it changes the moment but leaves the central question unresolved for another response.

Specimen C - Closed consequence

Open one specific effect by showing who notices, what becomes harder, or what decision must happen next.

Section map

Find the exact beat that stopped moving - failure_analysis / prose

Use the Scene Recovery Specimen Index - framework / checklist

Test one small repair instead of rewriting the scene - worked_example / examples

Let the selected role choose the recovery move - decision_rule / checklist

Carry one open consequence into the next turn - next_step / callout

Measurement caveat

The complete 28-day portfolio covers all eight published pages. Private growth readiness returned HTTP 503, so Search Console, landing UV, qualified outbound, and downstream attribution values are recorded as unavailable rather than zero. No orphan attribution callback was observed.
