

Daily SEO Growth Report

Shanghai date: 2026-08-03 | Published page: /how-to-choose-an-ai-roleplay-app

Release decision

Created one reviewed, policy-v4 page for the distinct pre-trial job: how to choose an AI roleplay app by story-entry criteria. The builder scored the selected opportunity 83: product fit, trial intent, and specificity 100; revenue intent 70; IP risk 0; cannibalization risk 10.

Quality and review gates

The English draft is 912 words with five body sections and three FAQs. It uses only four approved fact IDs, has an attributed NovelAI CTA and two contextual internal links, and makes no third-party IP, price, availability, privacy, safety, latency, or multiplayer claim. An identified codex_editor independently approved search intent, product truth, conversion path, and source accuracy.

Finalized portfolio snapshot

Published page	Exact-page GSC	Landing UV	Qualified outbound
/ai-roleplay-prompt-vs-existing-story	0 clicks / 0 impressions	0	0
/ai-voice-roleplay-story	0 / 0	4	0
/choose-a-role-ai-story	0 / 0	3	0
/how-to-start-ai-roleplay	0 / 0	0	0
/interactive-voice-story	0 / 0	5	0
/story-based-ai-roleplay	0 / 0	4	0

Window: 2026-07-03 through 2026-07-30. Every value is observed safely by source slug; the attribution join is checked and is not blocked.

Evidence, boundaries, and readiness

Six accessible public evidence records from six independent domains informed eight distinct searcher jobs. They support category and comparison intent only, not product claims or copied content. The official Google Trends UI was unavailable, so no relative-interest or search-volume inference was made.

Full funnel status

Search Console, URL Inspection, landing UV, and the attribution store were observed by the protected readiness probe. Full-loop readiness is unavailable because no recent signed NovelAI callback handshake exists and `ATtribution_SECRET` is not configured. This affects readiness reporting only: attribution join is not blocked. No trial, signup, payment, revenue, currency, purchase-event, click-ID, cohort, or callback-count data appears here.

Production verification

Local verification passed: 37 tests, experience contracts, TypeScript, production build, and static checks for all seven SEO pages including metadata, CTA routes, cross-links, robots, and sitemap entries. Deployment, live production verification, indexing, and backlink status remain pending until a scoped commit is pushed and Vercel is independently checked.

Feedback and next step

feedback:sync completed twice; local and remote inboxes had no unconsumed entries. Standing guidance was adopted: answer first, clear H2s, genuine FAQs, final CTA, contextual crawlable links, and explicit evidence boundaries. Next: commit only today's safe artifacts, push, then perform independent Vercel and live-page acceptance checks.
